

Simple Ecommerce Integration

We have easy step by step integration guides for all the major ecommerce platforms.

The image displays a multi-step process for integrating an AllAxis script into a Shopify theme. The interface is divided into several sections:

- Left Panel:** Shows the theme editor sidebar for the 'Debut' theme. A blue dashed box highlights the 'Edit code' option, with a callout bubble (1) stating: "Go to your Shopify admin site and 1.) Click on 'Customize' 2.) Click on 'Edit code'".
- Top Panel:** Shows the 'Edit code for Debut' interface. A blue dashed box highlights the 'theme.liquid' file in the 'Layout' section, with a callout bubble (3) stating: "3.) Click on '(/) theme.liquid' 4.) And add AllAxis script.".
- Code Editor:** Shows the 'theme.liquid' file with the AllAxis script being added. A blue dashed box highlights the script code, with a callout bubble (5) stating: "Add <div> element with a settings(data-allaxis-*) with location, client and product IDs. That is all.".
- Right Panel:** A light blue box contains the text: "Integrated with over 100 ecommerce platforms and mobile operating systems".

The code editor shows the following script being added to the 'theme.liquid' file:

```
polyfill.defer = true;
polyfill.src = "{{ 'iellCustomProperties.min.js' | asset_url }}";
scripts.parentNode.insertBefore(polyfill, scripts);
```

The code editor also shows the 'custom-content.liquid' file with the following code being added:

```
<div class="rte-setting rte">{{ block.settings.text }}</div>
</div>
<div
  data-allaxis-client-location="london"
  data-allaxis-client-id="demo"
  data-allaxis-product-id="product3"
  data-allaxis-width="400"
></div>
{% when "video" %}
<div class="video-wrapper"
  {% if block.settings.video
    <iframe src="//www.v
  {% else %}
  {% if block.sett
    <iframe src="/
  {% endif %}
  {% if block.setting
    <iframe src="//play
  {% endif %}
```
